Dear Sir:

I am unable to attend the public hearing to discuss the recommended cleanup action for the industrial area located in the northwestern part of Cadillac. The Cadillac City Council will be meeting in its regularly scheduled council meeting at the same time as your hearing.

I would like to address the problem of groundwater cleanup and I have instructed the City's Utilities Director, Donald Rennie, to represent the City in this regard. In addition, I would request that this letter be entered as part of the record.

Over six years ago the City of Cadillac recognized that there existed a problem of groundwater contamination in the industrial area of the city. At that time, we began a feasibility study to determine if a process utilizing a wood-fired cogeneration plant in conjunction with an air stripping device could clean up the water in the entire area, and do so at an affordable rate. Kysor Industrial Corporation soon became a partner in this project and we have finally moved to a point where we are ready to break ground on the project. We would have been operational if the Public Service Commission of Michigan had not held up the final approval during a protracted hearing on cogeneration in Michigan. Now that that is past, we are prepared to move forward. The City is preparing a method to ensure that there is adequate funding for the groundwater cleanup portion of the project, utilizing a special assessment to industries in the affected area. The City has invested funds as seed money to bring this project to this point in time, is a full partner in the project and will be providing the land in the City's Industrial Park.

This problem is Cadillac's problem. We believe we have the means to solve the problem. Therefore, we request that the EPA and MDNR work with us by recognizing the cogeneration project as the most expedient and preferred means of handling this environmental problem.

Sincerely,

Darrell D. Becker
Mayor
