Subject: RE: Ammonia Implementation - FY23 Facility Information

Good morning, Matt.

This is the spreadsheet that I used for Cadillac. I originally did the analysis back in early 2022 when I started building the model for this cycle, so the dates were January 2017-January 2022. I typically look at a 5-year period.

Generally, we have considered a monthly average limit achievable if the 95th percentile of the effluent data in a given season is less than the WQBEL. That is the case in each season for this facility. In each season the 95th percentile of the effluent data is at least 40% lower than the concentration-based WQBELs.

It is worth noting that the 99th percentile concentrations are higher than the monthly average WQBEL in 3 of the 4 seasons, but we typically look at the 99th percentile for daily max limits.

Please let me know if you need any additional information.

-Phillip

Hi Phillip,

Cadillac has requested more information on how we determined that they can meet their new tighter ammonia limits. I have your spreadsheet. Can you elaborate on what data you looked at (along with the range of dates considered).

Thanks!

Subject: Ammonia Implementation - FY23 Facility Information

Good afternoon,

I am attaching a spreadsheet that should help our discussion next week. The first tab is from the previous email and includes all of the FY23 WQBELs that I did for municipal facilities (55). The tab has color coding based on facilities not receiving tighter limits (Green), facilities receiving tighter limits that they can meet based on existing effluent quality (Yellow-Beige), and facilities that received tighter limits that they would not be able to meet (Orange).

I then added a second tab for the orange facilities. This tab provides a short description of secondary and tertiary treatment at the facility. The tab also provides a comparison of existing effluent quality versus WQBEL for the seasons of concern.

Note that while the orange facilities are the immediate concern, the yellow-beige facilities may also be a concern if the existing effluent quality is based on incidental ammonia removal due to increased facility retention time (Actual Flow << Design Flow).

Please let me know if you need any additional information ahead of the meeting next Thursday.

Phillip DePetro
