Thanks for the information, Claire.

We can have the MAHL / Local Limits report, proposed ordinance revisions, proposed IPP Procedures Manual and proposed IU permit revision submitted by 6/9/2023. Would this be an acceptable deadline for submittal of these documents for EGLE review?

Thanks,
Elaine

Elaine,

I'm happy to hear that you are making progress on the program revisions. I would certainly prefer that the updates are completed to your satisfaction before I review them, so yes, we can approve another extension. In future, however, please try to request an extension prior to the submittal due date. Please let me know a reasonable date you believe you can meet for the revisions.

On your question regarding the flow data, I followed up with the Biologist who calculated the WQBELs. The WQBELs were developed using low flow data upstream of the outfall. In this case low flow file 10194 was used. Low flows representative of a location upstream of the outfall is used for all WQBELs. If you have specific questions about the information used to develop the low flow, that question is best directed to Steve Holden holdens@michigan.gov, with the Hydrologic Studies Unit.

For the local limits, Cadillac may choose to allocate the MAIL in any way that results in an enforceable local limit that prevents pass through and interference. There is no requirement for the POTW to give a uniform concentration limit for all the IUs. Cadillac may choose to just use the MAIL as the local limit and allocate a portion of this to the IUs that discharge the pollutant in question, so a SAL wouldn't be required to give CCI a different limit. A couple of things to consider with this type of allocation. If mass-

based limits are used, then the IU must have the ability to demonstrate compliance with the limit, so flow metering would be required. The City should also take care not to favor one industry or group when allocating loading. This allocation method may be perceived as unfair if some IUs are pretreating and others are not. You may also consider using a combination of uniform limits and allocated loadings for different pollutants. The table below is an extract from the EPA Local Limits Development Guidance summarizing the pros and cons of different allocation methods, which might be helpful to you. A SAL is also an option, if preferred, but as you note a SAL procedure would also be required as part of the IPP Procedures and language would have to be included in the SUO to ensure that the SAL would be legally enforceable.

Table 6-2: Options for Allocating and Implementing Local Limits

Method	Pros	Cons
Allocate MAILs uniformly among all IUs and place uniform concentration limits in the local SUO	-Limits are clear to IUs -Requires little time to calculate limits -Easy to determine compliance	-Need to update SUO when limits change -Inflexible -Limits may be overly stringent because IUs may get an allocation but do not discharge pollutant
Place general language about complying with local limits in the local SUO and announce the actual uniform limits outside the SUO	-Do not have to revise the SUO every time local limits change -Easy to monitor for compliance -Relatively easy to calculate limits	-IUs may not be clear on the limits with which they must comply -Action may be overlooked by the general public and interested parties
Place general language about complying with local limits in the local SUO and place individual limits in IU permits	-Do not have to revise the SUO every time local limits change -Provides flexibility	-Requires issuing a permit to all IUs to which POTW wants limits to apply -Action may be overlooked by the general public and interested parties
Put MAILs in SUO, allocate loadings on an IU contributory flow or mass proportion basis, and place limits in IU permits	-Only IUs that discharge a pollutant are given a full allocation so limits are more efficiently allocated -Helps avoid setting excessively stringent or unattainable limits	-Requires knowing more about IU discharges (need to know their pollutant content) -Requires updating the SUO when MAILs change -Requires issuing permits to all IUs with discharge limits -May penalize IUs that are currently pretreating while others are not
Put MAILs in SUO, allocate loadings on a case-by-case basis to those IUs that need an allocation for a specific pollutant, and place limits in IU permits	-Only IUs that discharge a pollutant are given a full allocation so limits are more efficiently allocated -Helps avoid setting excessively stringent or unattainable limits -Provides flexibility	-Requires knowing more about IU discharges (need to know their pollutant content) and applicable pretreatment systems -More time-consuming to determine allocations -Can lead to an inequitable allocation among IUs -Requires updating SUO when MAILs change -Requires issuing permits to all IUs with discharge limits

Please let me know if you have any further questions.

Hi Claire –

We're making progress on the Cadillac IPP update. Here's a summary of what we've done to date:

1. WWTP influent, primary effluent, final effluent, and CIU/SIU sampling and analysis
2. Draft MAHL and local limits calculations – reviewed with the City and there are a few minor tweaks to make before drafting the report for EGLE review
3. Site visit to Cadillac Castings to review their process and wastewater management/treatment and to gather info needed to calculate categorical limits
4. We will be scheduling site visits to the other permitted IUs in the near future to verify categorical classification and review their pretreatment and sampling locations

We have a couple questions for you.

1. Cadillac participates in stream gauging/data collection with EGLE annually. The City just received an invoice for it. Do the WQBELs you sent me incorporate this data?
2. Would EGLE consider a non-uniform allocation for molybdenum? Cadillac Castings is the major contributor for this pollutant and would like a larger "piece of the pie" as they currently have issues meeting the limit and our draft local limits calculations indicate a lower local limit would be needed if we used a uniform allocation for this update. We would like to consider a Special Alternative Limit (SAL) for this parameter for CCI.
3. An updated IPP procedures manual was supposed to be submitted by March 15; can this be extended a bit so that the procedures manual can incorporate the proposed MAHL/local limits,

proposed ordinance updates (including more robust FOG program), and procedures for SAL development and implementation.

Thanks,
Elaine
