Subject: RE: Cadillac WWTP - IPP PFAS Interim Report Review

Tom,

1. Upon review of this additional information and discussion with my colleagues who also review IPP PFAS Interim Reports, we believe Avon Automotive should be sampled for PFAS as a probable source. The letter received from 3M's Regulator Affairs representative concerning the Dyneon additives indicates that even when PFAS are not intentionally used in the manufacturing of these additives, PFAS may still be detected at parts per billion quantities as unintended impurities. The screening level for PFOS under this initiative is 12 parts per trillion so there is the potential for Avon Automotive to exceed this. Also, we have found PFOS above the screening level at another facility using a 3M "Dyneon" product. We believe these are good reasons to complete a probable source evaluation at Avon with a sample of their discharge. You can add these sample results to your Summary Report (due 11/30/18) by submitting a revised version of the report when the results become available.

We are ordering bottles to test Avon Automotive today. We believe bottles will come in early next week. We are anticipating a Wednesday sample from them.

2. One additional question/clarification concerning Rec Boat Holdings: Do they have a discharge of process wastewater to the Cadillac WWTP? It sounds like they are basically an assembly facility? They do discharge process water. They rinse the trailers down before they coat them.
3. My understanding is you are continuing to evaluate and work with your landfill. We can discuss this further at your convenience, but as above, if necessary you can upload a revised Summary Report version as more landfill data becomes available. Currently we are waiting the Landfill to contact us with a treatment plan. They seem somewhat reluctant

Subject: RE: Cadillac WWTP - IPP PFAS Interim Report Review

Mr. Dietlin,

I apologize for the delay in this response. Thank you for your thorough follow-up. The additional information was very helpful and answered many of my questions. I have three comments/questions below:

1. Upon review of this additional information and discussion with my colleagues who also review IPP PFAS Interim Reports, we believe Avon Automotive should be sampled for PFAS as a probable source. The letter received from 3M's Regulator Affairs representative concerning the Dyneon additives indicates that even when PFAS are not intentionally used in the manufacturing of these additives, PFAS may still be detected at parts per billion quantities as unintended impurities. The screening level for PFOS under this initiative is 12 parts per trillion so there is the potential for Avon Automotive to exceed this. Also, we have found PFOS above the screening level at another facility using a 3M "Dyneon" product. We believe these are good reasons to complete a probable source evaluation at Avon with a sample of their discharge. You can add these sample results to your Summary Report (due 11/30/18) by submitting a revised version of the report when the results become available.
2. One additional question/clarification concerning Rec Boat Holdings: Do they have a discharge of process wastewater to the Cadillac WWTP? It sounds like they are basically an assembly facility?
3. My understanding is you are continuing to evaluate and work with your landfill. We can discuss this further at your convenience, but as above, if necessary you can upload a revised Summary Report version as more landfill data becomes available.

Please respond to the questions in Item 2 of this email and include a schedule for when the Avon Automotive PFAS sample results will be submitted for Item 1.

Thanks again for your follow-up,
Tom

Subject: RE: Cadillac WWTP - IPP PFAS Interim Report Review

Mr. Thomas P. Berdinski,

In response to your concerns regarding our PFAS Interim Report I have answered your questions in the order you asked them.

1. AAR Manufacturing, yes they did provide SDS sheets with their survey submission. AAR did a thorough scan of their chemical inventory and did not find any of the chemicals of concern that the DEQ had initially put out for us to look for. You will find the SDS sheets and letters from the manufactures on the chemicals in question attached.
2. Rec Boat, although labeled as a metal finisher Rec Boats trailer plant starts with raw material and constructs boat trailers.
3. Michigan Rubber Products, attached you will find SDS sheets and an email response from MRP stating that the chemicals in question are used on molds that never come in contact with any water.
4. Avon Automotive, attached you will find SDS sheets and letters from the chemical manufactures stating that the chemicals in question do not contain PFOS or PFOA.
5. Arvco Container Company, as stated in Arvco's survey they use 5-20% recycled paper that is new roll stock bought from paper companies. The paper never comes in contact with water at their facility. Attached is a letter from Arvco.
6. Hutchinson AntiVibration Systems, yes they did provide an SDS sheet for the chemical in question. It's an adhesive and does not come in contact with water. You will find the SDS and an email attached.

Please see the attachments. If you have any further questions do not hesitate to contact us.

Tom,

Sorry for the late notice but we will need some extra time. Still chasing down some answers to your questions.

I would think next week for sure.

Subject: Cadillac WWTP - IPP PFAS Interim Report Review

Hello Mr. Dietlin,

I wanted to let you know I appreciate you completing the IPP PFAS Interim Report and submitting it via MiWaters. It was also helpful that you uploaded the surveys with your Interim Report. Upon review of these, I had a few questions I would like to discuss with you.

With the concerns about PFAS and their increasing links to human health effects, we want to be especially thorough in potential and probable PFAS source evaluations. We have continued to learn more about sources of PFAS since the original letter went out on February 20, 2018. Some of the questions I have below are the result of surveys and sources identified by other POTWs undertaking this effort.

So, with these things in mind, I have a few questions for you:

1. In our February 20, 2018 letter, and in the seminars and guidance documents that followed, we identified metal finishers as likely “potential sources” that should be evaluated for PFAS usage. AAR Mobility Systems Cadillac (4 locations) is identified in your report as a potential source and as a categorical user subject to the metal finishing regulations. Specifically, the survey AAR completed indicates that they use a defoamer (Foam Rid 30) and perform chemical etching (Sulfuric Acid, Ferri Flocc). Some defoamers and some etching chemicals have been found to be sources of PFAS. Did AAR provide SDS sheets or other information to you adequately demonstrating that they do not discharge fluorinated compounds such as PFOS and PFOA? (Note: Sometimes chemical suppliers do not disclose PFAS or other fluorinated compounds on their SDS sheets, considering them to be “proprietary compounds”. In some cases, it provides a greater peace of mind to simply sample the industry to get a definitive analytical determination versus attempting to interpret SDS sheets and other information provided by a chemical supplier.)
2. Rec Boat Holdings, Trailer Division, is identified in your report as a potential source and also as a metal finisher. Their survey did not provide information on their processes or discharges. They indicated “N/A” to all of the metal finishing questions. What is the nature of their categorical classification?
3. Michigan Rubber Products indicated the use of several products containing Teflon/PFTE. I am unable to determine from information available to me what the source of their wastewater discharge is? Would the wastewater discharge from Michigan Rubber Products be expected to come into contact with the Teflon containing products they identified?
4. Avon Automotive indicated the use of “fluoro” chemicals in their survey response. Would any of these chemicals be expected in their discharge? If so, did Avon Automotive also provide SDS sheets or other information to you adequately demonstrating that these chemicals would not be sources of PFOS and PFOA?
5. The Arvco Container Corporation indicated the use of recycled paper. Paper and cardboard used in food packaging seem to be the more common PFAS sources. Do you know the source of the recycled paper used by Arvco? What is the source of the wastewater discharge from Arvco Container Corporation? Would recycled paper come into contact with the wastewater?
6. Hutchinson AntiVibration Systems identified a fluorinated chemical in their survey response. Would this chemical be expected in their discharge? If so, did they provide the SDS sheets or other information to you adequately demonstrating that this chemical would not be a source of PFOS and PFOA?

Please answer the questions above on or before September 14, 2018. If more time is needed, please let me know. Also, if you would like to discuss this over the phone please feel free to call (my number is below). Thanks again for your help with the IPP PFAS initiative.

Tom
