Subject: RE: Biosolids Incorp

Hi Doug – I have read over both letters. I found it interesting in Midwest's letter that they state they could 'reduce the application rate'.

The reason I question this, is because when I spoke with them out on the field that Spring day, they told me they couldn't adjust the rate. That it comes out at one speed and all they could do was try to drive the tractor slower or faster.

So, my question – Is that what they actually mean? The speed of the tractor, or the rate of the biosolids coming out of the hoses?

The speed of the tractor determines how well the biosolids are incorporated into the soils.

On that Spring day, they made it sound like for the steep slope areas that they only way they could avoid run-off was to increase the speed of the tractor on the slopes, which I would believe would not then be tilled/disked in very well.

It shouldn't be a problem on the 0-6% slopes, just on the 6-12% slopes. Thankfully, they are stating they will conduct an 'additional dry pass'

Because the plant is a Class B facility (by its' RMP), and the plant's RMP calls for Sub-injection (the VAR), a significant amount of the biosolids must not be present on the land surface within 1 hour after they are injected.

But, due to the processing of the biosolids at the plant and all the testing for pathogens meeting a Class A facility at the plant, the plant would meet the provision of being able to incorporate within 8 hours.

- Which brings me to Midwest's mention ofno biosolids are visible w/in 6 hrs of application.....

I also liked how they mentioned that they will have the correct sub-injection equipment the next time they haul for the plant. That is good to know and have in writing.

I will add both of these letters to Cadillac's file.

If you could let me know when you start hauling I would appreciate it.
Thanks.

Cindy,
I have attached the letters you requested for biosolids incorporation.
Thanks Doug
