Subject: Reviewing biosolids annual report and documents - Questions

Hi Doug & Jeff – I'm in the process of reviewing biosolids annual reports and I have a question regarding the metals/nutrient lab results submitted with the report. These were completed by PACE Analytical. There are two metals result documents from PACE, dated: 9/4/18 and 4/8/19.

- The Analytical Methods are different. The Sept. 2018 is EPA 6010C, and the April 2019 is EPA 6020.
- The Preparation Methods are the same for both dates.

Looking at the Sept. data results, they are throwing a red flag at me.

1. The Molybdenum & Selenium results are both <61.1.
 - A 'less than' for a high number of 61, tells me something is up with the testing equipment or the test was not conducted correctly.
 - The result is a lot higher than you past sampling results.
 - The results from April 2019 are more likely accurate and coincide with past results.
2. Question # 1 – Did you realize that the Arsenic result is over Table 3? It was 61.4
 - The Arsenic limit for Table 3 is 41 & the loading rate is 37 lbs/ac
3. Question # 2 - Are the sampling results from Sept. 2018 correct?
 - If the results they are correct, that means the biosolids land applied are now CPLR fields.
4. Question # 3 - Were these fields already CPLR sites?
5. Question # 4 - Is the WWTP tracking the loading rates applied to each of these fields?
 - Those fields applied to in Oct. 2018.

If the results from the Sept. 2018 sampling event are correct, this may mean the Cadillac WWTP does not meet the requirements of a Class A, EQ facility.

Would you please look into the results (from Sept. 2018) and discuss with the lab. to find out if something happened or what their explanation could be when comparing the two different results; and then let me know what you find out.

I'm in the office today, with a meeting from 1-2:30, and done at 4:30. I'm off Fri., next Mon. is Veteran's Day and the office is closed, next Tues. I'm in and out throughout the day and available Wed. – Fri. 7 am to 4:30pm.

Cindy
