

Statement:

Kysor of Cadillac, Inc. and Northernaire Plating Company,
Cadillac, Michigan Feasibility Study.

Date: August 7, 1989

Location: Wexford County Courthouse

Nearly eleven years ago, the City of Cadillac became aware that groundwater was being contaminated by a plating operation near the City Well Field. Subsequently, several other contamination plumes have been identified in the same general area of the City, all of which have the potential to contaminate the public water supply. During the ensuing eleven years a large amount of effort and money has went into evaluating this, admittedly complex problem. Unfortunately very little in the way of real 'clean-up' has taken place and the City water supply, while showing no sign of contamination at this time remains in the same relative position it was in eleven years ago.

The City of Cadillac has three very simple goals that are related to this process. First, to insure that our public water supply is protected from contamination; Second to see effective clean-up of existing contaminants take place as rapidly as possible and do so while retaining existing industry and the jobs they represent along with encouraging continued industrial, commercial and community growth.

The City believes that the Co-Generation facility as proposed by Cogeneration Michigan, Inc. will be able to accomplish the task of groundwater clean up for the study area in such a way that it will meet all of the City's goals and do so in a complete and cost effective manner. It most certainly will be able to complete the cleanup process in much less than the 64 years proposed in the Feasibility Study under consideration at this time. In addition, using Cogeneration as the method of choice for clean up will not cost the taxpayer anything as compared to the millions of dollars in capital and operating costs contained in the Feasibility Study.

To begin the process of cost allocation, Cogeneration Michigan, Inc. has hired a consultant to prepare a special assessment process to spread the collection and treatment costs between the several industries which will be involved in the clean up.

The City of Cadillac remains committed to a speedy and yet cost effective process of groundwater clean up. We believe that the planned Cogeneration facility has the best opportunity of reaching those goals.
