Subject: Re: Cadillac WWTP - WQBEL follow-up

Hi Jeff-

I checked on all the issues and it looks like lindane's okay - I had inserted 0.1 instead of 0.01 for the resonable potential calculations. So, the lindane monitoring can come out. In regards to TRC and MTBE, I concur with your recommendations as stated below in your email dated 4/10/08. Also, yes, the 1/4 monitorig for copper can be removed form the permit.

I think that's it. I checked on the chronic limit and that should probably stay. The RP came out to be 3.8 based on the one test conducted by MDEQ in May 2007 that resulted in a TUc of 2.4. The chronic limit is 1.1, so the exceedance was well above that. There were a total of 12 tests used for the RP determination. Hope this info helps in your discussion with the facility.

Let me know if you need anything else.

Sylvia

Hi Sylvia,

I went back and looked at the monthly DMR data in NMS for Lindane and all of the reported/recorded values were either <0.01 or 0.01 ug/l, I did not see any 0.1 values? Not sure where the discrepancy comes from...is the data you based your recommendations on taken from NMS or some other source? Let me know and I will investigate if need be to ensure that we are basing our decision on accurate data.

Regarding Total Residual Chlorine, the permittee now utilizes UV disinfection, but still retains that ability to chlorinate. Therefore, a limit will not be included on the effluent limits page of the permit, but a condition stating that if the permittee needs to use chemical disinfection they must meet the 0.038 mg/l WQS.

Also, just to verify what we discussed, although not indicated in your recommendations memo, you said that the current monitoring requirement for total copper is not longer needed and could be removed from the permit.

Finally, you recommend quarterly monitoring of the effluent for MTBE, I assume, in response to the letter submitted by the applicant stating they plan on accepting the effluent from a LUST groundwater clean-up that contains MTBE. I contacted the superintendent to inquire as to whether or not they are, or anticipate accepting this waste stream in the future. He said that they were not currently accepting it and could not say whether they would or not in the future. He said that cost was an issue, and also that they wanted the WWTP to accept the entire volume of water from the purge wells, 1.0 MGD, which he said they could not do as it would upset the treatment system. Therefore, I propose to include a special condition in the permit that requires the permittee to notify the department when they start accepting the wastewater and monitoring their effluent for MTBE on a more frequent basis than you recommend, but for a shorter period of time. This way we can get a larger data set to evaluate the effects of this wastestream on the quality of their final effluent an determine if additional requirements are necessary. Is this acceptable to you...let me know what you think?

Let me know if you have any questions. Thanks much!

Jeff
