Subject: Fecal Coliform (NPDES MI0020257)

Don –

At the beginning of March, we switched our in-house analytical method for fecal coliform in our effluent (Monitoring Point 001A) from membrane filter (SM 9222 D) to Colilert-18 (IDEXX). Both of these methods are approved for wastewater in 40 CFR Part 136.3, Table 1A. As a result of this switch, there are two items to which I want to call your attention:

Our reporting units have switched from CFU/100mL to MPN/100mL.

The reporting limit for the Colilert-18 method is 1 (MPN/100mL). Therefore, a “zero” well count is now reported as <1 (MPN/100mL). However, to calculate the geometric mean (as required for the DMR monthly and 7-day values) we are dropping the “less than” designator and using the numerical value of “1” (when applicable) in our calculations.

If you have any questions or require any additional information regarding these items, please just let me know. Thanks,

Cindy A. Tomaszewski
